

Device Types Documentation

i This documentation provides an overview of the device types used in our system. The system interacts with the backend Node.js application and utilizes MongoDB as the database. The connection between the system and the backend is secured through a VPN (Virtual Private Network). The device types listed below are specifically designed for our smoke alarm systems (web), enabling agents, contractors, agencies, and administrators to perform various actions related to configuration, invoicing, setups, and more.

⚠ WARNING: Work in Progress (WIP)

This documentation is currently a work in progress and subject to updates, changes, and revisions. We are in the process of documenting the device types used in our system, their functionalities, and their interaction with the backend infrastructure.

Your input, feedback, criticism, and suggestions are highly appreciated during this stage. We value your expertise and insights, which can significantly contribute to the accuracy, completeness, and clarity of this documentation. If you notice any inconsistencies, missing information, or have recommendations for improvements, please don't hesitate to provide your feedback.

As we strive to create a comprehensive and reliable resource, your active participation is invaluable. Together, we can ensure that this documentation reflects the most up-to-date and accurate information about our system's device types, backend architecture, and security measures.

Thank you for your understanding, collaboration, and contribution in refining this documentation. We appreciate your involvement in shaping a robust and user-friendly system for all stakeholders involved.

Exported Device Types:

1. Android:

- ID: 1
- Code: android
- Name: Android

The Android device type represents devices running the Android operating system. Users can access the system and perform various actions using Android devices.

2. iOS:

- ID: 2
- Code: ios
- Name: iOS

The iOS device type represents devices running the iOS operating system. Users can access the system and perform various actions using iOS devices.

3. Web:

- ID: 3
- Code: web
- Name: Web

The Web device type represents devices accessing the system through web browsers. Users can utilize the web interface to perform various actions and manage the smoke alarm systems.

The system's backend, built on Node.js, provides APIs that facilitate communication between the frontend and the database. MongoDB serves as the underlying database technology, storing and retrieving data for the system's functionalities.

The secure connection established via a VPN ensures the confidentiality and integrity of data exchanged between the system and the backend. This ensures a safe and reliable environment for performing operations related to smoke alarm system configuration, invoicing, setups, and more.

Please note that this documentation may be updated or expanded as the system evolves or additional device types are introduced. Your feedback and suggestions are welcome to improve and enhance this documentation.
