

KORE Super SIM

We use KORE (previously Twilio) Super SIM for our cellular connectivity.

- These SIM cards automatically connect to any available network we've allowed.
- For the AU Pilot Fleet, the available networks are Telstra, Optus and Vodafone.
- The SIM will initially attempt to connect to Telstra, as it's the only item in the OPLMN, as per Twilio support:

Regarding your question on OPLMN list,

U.S. AT&T

Australia Telstra

New Zealand Spark

- If it fails to connect to Telstra, it will then try Optus and Vodafone.
- Once connected it will re-connect to the last connected network initially, then continue through the list.

Data Usage

Regarding your question "Is there a minimum usage or connection time for these to show in this report? Do SIM cards in the Ready state show up in this report, or do they only show once they progress to the Active state?"

Data usage will show for active sims and not sims in ready status.

- <https://www.twilio.com/docs/iot/supersim/how-to-determine-a-super-sims-status>
- The Sim resource's Super SIM can connect to the network and is capable of consuming network resources in accordance with the configuration of the [Fleet resource](#) to which it has been assigned (indicated by the Sim resource's `fleet_sid` property), **but no monthly subscription fee will be charged.**

A Sim resource's status can only be switched to `ready` if it currently `new`. Once a `ready` Super SIM has consumed 250KB of data, five SMS Commands have been sent or received by the Super SIM, or three months have passed, the Sim resource's state will automatically transition to `active`.
